General instructions	68

Features

- Variable axial piston pump of swashplate design for hydrostatic drives in closed circuit.
- The flow is proportional to the drive speed and displacement.
- The flow can be infinitely varied by adjusting the swashplate angle.
- Flow direction changes smoothly when the swashplate is moved through the neutral position.
- A wide range of highly adaptable control devices with different control and regulating functions, for all important applications.
- Two pressure-relief valves are provided on the high-pressure side to protect the hydrostatic transmission (pump and motor) from overload.
- The high-pressure relief valves also function as boost valves.
- The integrated boost pump acts as a feed pump and control pressure supply.
- The maximum boost pressure is limited by a built-in low-pressure relief valve.
- As standard with integrated pressure cut-off

Technical data

Hydraulic fluid

Before starting project planning, please refer to our data sheets RE 90220 (mineral oil), RE 90221 (environmentally acceptable hydraulic fluids) and RE 90222 (HFD hydraulic fluids) for detailed information regarding the choice of hydraulic fluid and application conditions.

The variable pump A4VG is not suitable for operation with HFA, HFB and HFC hydraulic fluids. If HFD or environmentally acceptable hydraulic fluids are used, the limitations regarding technical data or other seals must be observed. Please contact us.

Selection diagram

Details regarding the choice of hydraulic fluid

The correct choice of hydraulic fluid requires knowledge of the operating temperature in relation to the ambient temperature: in a closed circuit, the circuit temperature.

The hydraulic fluid should be chosen so that the operating viscosity in the operating temperature range is within the optimum range (v_{opt} see shaded area of the selection diagram). We recommended that the higher viscosity class be selected in each case.

Example: At an ambient temperature of X $^\circ\text{C}$, an operating temperature of 60 $^\circ\text{C}$ is set in the circuit. In the optimum operating viscosity range (v_{opt} , shaded area), this corresponds to the viscosity classes VG 46 and VG 68; to be selected: VG 68.

Note

The case drain temperature, which is affected by pressure and speed, can be higher than the circuit temperature. At no point of the component may the temperature be higher than 115 $^\circ\text{C}$. The temperature difference specified below is to be taken into account when determining the viscosity in the bearing.

If the above conditions cannot be maintained due to extreme operating parameters, please contact us.

Viscosity and temperature of hydraulic fluid

	Viscosity [mm^2/s]	Temperature	Comment
Transport and storage at ambient temperature		$T_{\text{min}} \geq -50$ $^\circ\text{C}$ $T_{\text{opt}} = +5$ $^\circ\text{C}$ to $+20$ $^\circ\text{C}$	Factory preservation: up to 12 months with standard, up to 24 months with long-term
(Cold) start-up ¹⁾	$v_{\text{max}} = 1600$	$T_{\text{St}} \geq -40$ $^\circ\text{C}$	$t \leq 3$ min, without load ($p \leq 50$ bar), $n \leq 1000$ rpm
Permissible temperature difference		$\Delta T \leq 25$ K	between axial piston unit and hydraulic fluid
Warm-up phase	$v < 1600$ to 400	$T = -40$ $^\circ\text{C}$ to -25 $^\circ\text{C}$	at $p \leq 0.7 \cdot p_{\text{nom}}$, $n \leq 0.5 \cdot n_{\text{nom}}$ and $t \leq 15$ min
Operating phase			
Temperature difference		$\Delta T = \text{approx. } 5$ K	between hydraulic fluid in the bearing and at port T
Maximum temperature		115 $^\circ\text{C}$ 110 $^\circ\text{C}$	in the bearing measured at port T
Continuous operation	$v = 400$ to 10 $v_{\text{opt}} = 36$ to 16	$T = -25$ $^\circ\text{C}$ to $+90$ $^\circ\text{C}$	measured at port T, no restriction within the permissible data
Short-term operation	$v_{\text{min}} \geq 7$	$T_{\text{max}} = +110$ $^\circ\text{C}$	measured at port T, $t < 3$ min, $p < 0.3 \cdot p_{\text{nom}}$
FKM shaft seal ¹⁾		$T \leq +115$ $^\circ\text{C}$	see page 7

1) At temperatures below -25 $^\circ\text{C}$, an NBR shaft seal is required (permissible temperature range: -40 $^\circ\text{C}$ to $+90$ $^\circ\text{C}$).

Technical data

Filtration of the hydraulic fluid

Finer filtration improves the cleanliness level of the hydraulic fluid, which increases the service life of the axial piston unit.

To ensure the functional reliability of the axial piston unit, a gravimetric analysis of the hydraulic fluid is necessary to determine the amount of solid contaminant and to determine the cleanliness level according to ISO 4406. A cleanliness level of at least 20/18/15 is to be maintained.

Depending on the system and the application, for the A4VG, we recommend

Filter cartridges $\beta_{20} \geq 100$.

With an increasing differential pressure at the filter cartridges, the β value must not deteriorate.

At very high hydraulic fluid temperatures (90 °C to maximum 115 °C), a cleanliness level of at least 19/17/14 according to ISO 4406 is necessary.

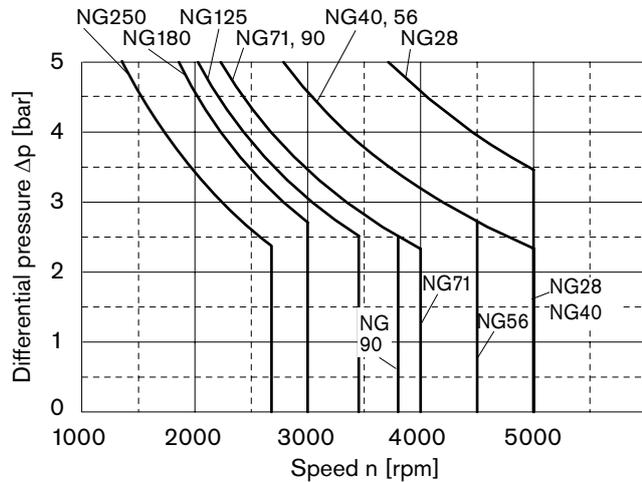

If the above classes cannot be achieved, please contact us. For notes on filtration types, see page 57.

Shaft seal

Permissible pressure loading

The service life of the shaft seal is influenced by the speed of the axial piston unit and the case drain pressure (case pressure p_G). The mean differential pressure of 2 bar between the case and the ambient pressure may not be enduringly exceeded at normal operating temperature. For a higher differential pressure at reduced speed, see diagram. Momentary pressure spikes ($t < 0.1$ s) of up to 10 bar are permitted. The service life of the shaft seal decreases with an increase in the frequency of pressure spikes.

The case pressure must be equal to or higher than the ambient pressure.

These values are valid for an ambient pressure $p_{abs} = 1$ bar.

Temperature range

The FKM shaft seal may be used for case drain temperatures from -25 °C to +115 °C.

Note

For application cases below -25 °C, an NBR shaft seal is required (permissible temperature range: -40 °C to +90 °C). State NBR shaft seal in plain text when ordering. Please contact us.

Technical data

Operating pressure range

(operating with mineral oil)

Pressure at service line port A or B

Nominal pressure p_{nom} _____ 400 bar absolute

Maximum pressure p_{max} _____ 450 bar absolute

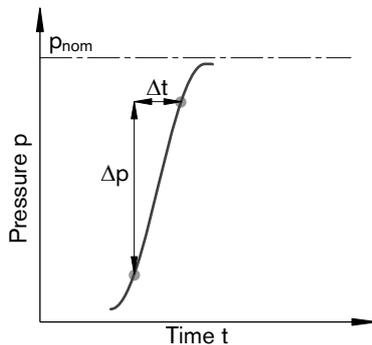

Single operating period _____ 10 s

Total operating period at n_{nom} _____ 300 h

Minimum pressure (high-pressure side) _____ 25 bar absolute

Minimum pressure (low-pressure side) _____ 10 bar over p_G
(boost pressure setting must be higher, depending on system)

Rate of pressure change $R_{A\ max}$ _____ 9000 bar/s

Boost pump

Pressure at suction port S

Continuous $p_{S\ min}$ ($v \leq 30\ mm^2/s$) _____ ≥ 0.8 bar absolute

Short-term, on cold start ($t < 3\ min$) _____ ≥ 0.5 bar absolute

Maximum $p_{S\ max}$ _____ ≤ 5 bar absolute

Nominal pressure $p_{Sp\ nom}$ _____ 25 bar absolute

Maximum pressure $p_{Sp\ max}$ _____ 40 bar absolute

Control pressure

To ensure the function of the control, the following control pressure is required depending on the speed and operating pressure (measuring point, port P_S):

For controls EP, HW and HD

Minimum control pressure

$p_{St\ min}$ (at $n = 2000\ rpm$) _____ 20 bar over p_G

For control DA, DG, EZ

Minimum control pressure

$p_{St\ min}$ (at $n = 2000\ rpm$) _____ 25 bar over p_G

Note

Values for other hydraulic fluids, please contact us.

p_G = case pressure

Definition

Nominal pressure p_{nom}

The nominal pressure corresponds to the maximum design pressure.

Maximum pressure p_{max}

The maximum pressure corresponds to the maximum operating pressure within the single operating period. The sum of the single operating periods must not exceed the total operating period.

Minimum pressure (high-pressure side)

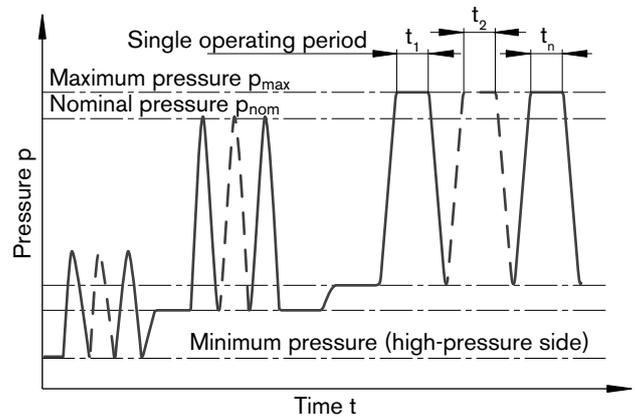

Minimum pressure at the high-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Minimum pressure (low-pressure side)

Minimum pressure at the low-pressure side (A or B) which is required in order to prevent damage to the axial piston unit.

Rate of pressure change R_A

Maximum permissible rate of pressure rise and reduction during a pressure change over the entire pressure range.

Total operating period = $t_1 + t_2 + \dots + t_n$

Technical data

Center of gravity ⁶⁾	X	mm	< 5	< 5	< 5	< 5	< 5	< 5	< 5	< 5	
	Y	mm	24	20	20	15	20	30	33	30	
	Z	mm	105	112	106	135	145	160	180	203	

1) The values are valid:

- for the optimum viscosity range from $v_{opt} = 36$ to 16 mm²/s
- with hydraulic fluid based on mineral oils

2) Limited maximum speed:

- at half of corner power (e. g. at $V_{g \max}$ and $p_N / 2$)

3) Intermittent maximum speed:

- at high idle speed
- at overspeed: $\Delta p = 70$ to 150 bar and $V_{g \max}$
- at reversing peaks: $\Delta p < 300$ bar and $t < 0.1$ s.

4) Without boost pump

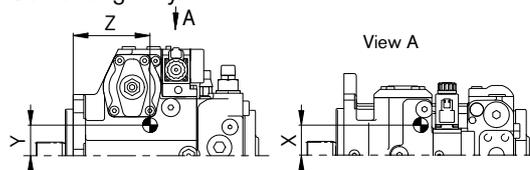

5) The data are valid for values between the minimum required and maximum permissible speed.

Valid for external excitation (e. g. engine 2 to 8 times rotary frequency; cardan shaft twice the rotary frequency).

The limit value applies for a single pump only.

The load capacity of the connection parts must be considered.

6) Center of gravity

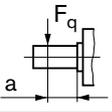

Note:

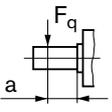

Operation above the maximum values or below the minimum values may result in a loss of function, a reduced service life or in the destruction of the axial piston unit. We recommend testing the loads by means of experiment or calculation / simulation and comparison with the permissible values.

Maximum through-drive torque ⁴⁾	$T_{D \max}$	Nm	231	314	521	660	822	1110	1760	2230	

- 1) Efficiency not considered
- 2) For drive shafts without radial force
- 3) Shaft "U" is only permissible as a drive shaft for the **2nd pump** in a combination pump of the same size.
- 4) Note maximum input torque at **shaft S!**

Torque distribution

T_E and T_D consists as follows:

$$T_E = T_1 + T_2 + T_3$$

$$T_D = T_2 + T_3$$

$$T_E < T_{E \max}$$

$$T_D < T_{D \max}$$

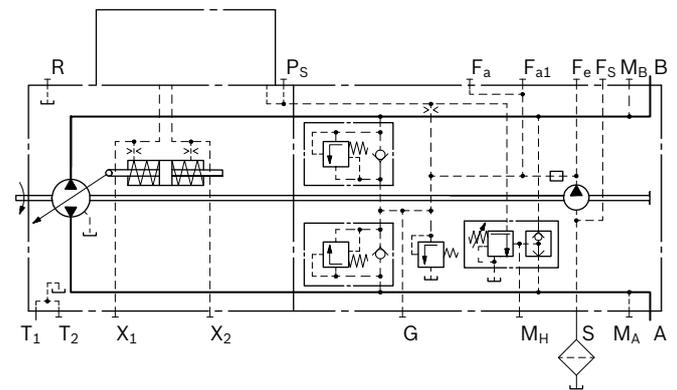

Determining the operating characteristics

Flow	$q_v = \frac{V_g \cdot n \cdot \eta_v}{1000}$	[L/min]	V_g = Displacement per revolution in cm^3
			Δp = Differential pressure in bar
Torque	$T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}}$	[Nm]	n = Speed in rpm
			η_v = Volumetric efficiency
Power	$P = \frac{2 \pi \cdot T \cdot n}{60000} = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t}$	[kW]	η_{mh} = Mechanical-hydraulic efficiency
			η_t = Total efficiency ($\eta_t = \eta_v \cdot \eta_{mh}$)

NV – Version without control module

The mounting surface for the control module is machined and is sealed with the standard seal for control modules and a cover plate. This version is ready for retrofitting to control modules (HD, HW, EP, EZ). When used directly for "DA" control and in combinations with "DA" control, the appropriate adjustments must be made to the spring assembly of the control cylinder and control plate.

Standard version¹⁾

1) Sizes 28 and 250 without ports Fa1 and Fs

DG – Hydraulic control, direct controlled

With the direct hydraulic control (DG), the output flow of the pump is controlled by a hydraulic control pressure, applied directly to the stroking piston through either port X1 or X2.

Flow direction is determined by which control pressure port is pressurized (refer to table below).

Pump displacement is infinitely variable and proportional to the applied control pressure, but is also influenced by system pressure and pump drive speed.

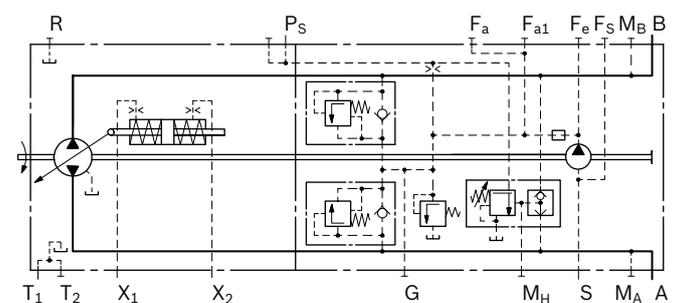

The pressure cut-off and the DA control valve only become effective if the pilot control device used for controlling the DG control is supplied from port Ps.

Maximum permissible control pressure: 40 bar

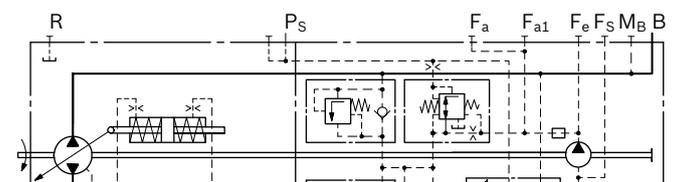

Use of the DG control requires a review of the engine and vehicle parameters to ensure that the pump is set up correctly. We recommend that all DG applications be reviewed by a Bosch Rexroth application engineer.

If the pump is also equipped with a DA control valve (see page 17), automotive operation is possible for travel drives.

Standard version¹⁾

Version with DA control valve¹⁾

1) Sizes 28 and 250 without ports Fa1 and Fs

Correlation Direction of rotation – Control – Flow direction

		Size	Control pressure	Flow direction	Operating pressure
Direction of rotation	cw	28 to 56	X1	A to B	M _B
			X2	B to A	M _A
		71 to 250	X1	B to A	M _A
			X2	A to B	M _B
	ccw	28 to 56	X1	B to A	M _A
			X2	A to B	M _B
71 to 250		X1	A to B	M _B	
		X2	B to A	M _A	

HD – Proportional control hydraulic, pilot-pressure related

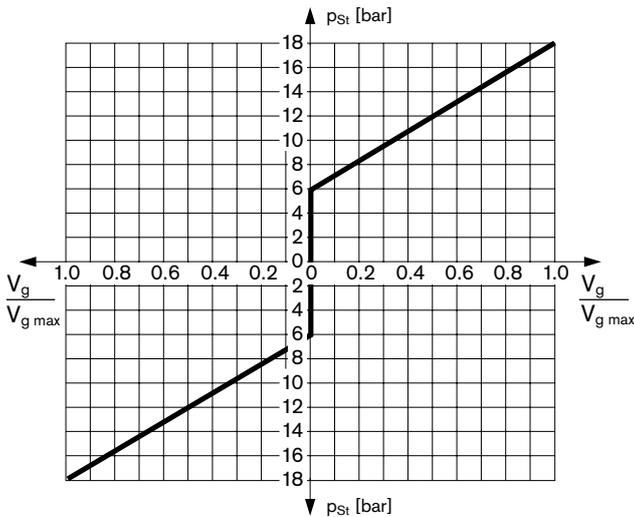

The output flow of the pump is infinitely variable between 0 to 100 %, proportional to the difference in pilot pressure applied to the two control ports (Y₁ and Y₂).

The pilot signal, coming from an external source, is a pressure signal. Flow is negligible, as the pilot signal acts only on the spool of the control valve.

This valve spool then directs control oil into and out of the stroking cylinder to adjust pump displacement as required.

A feedback lever, connected to the stroking piston maintains the pump flow for any given pilot signal within the control range.

If the pump is also equipped with a DA control valve (see page 17), automotive operation is possible for travel drives.

V_g = Displacement at p_{St}

$V_{g\ max}$ = Displacement at $p_{St} = 18\ \text{bar}$

Pilot signal $p_{St} = 6\ \text{to}\ 18\ \text{bar}$ (at port Y₁, Y₂)

Beginning of control at 6 bar

End of control at 18 bar (maximum displacement $V_{g\ max}$)

Note:

In the neutral position, the HD control module must be vented to reservoir via the external pilot control device.

Note

The spring return feature in the control module is not a safety device

The control module can stick in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the control will no longer respond correctly to the operator's commands.

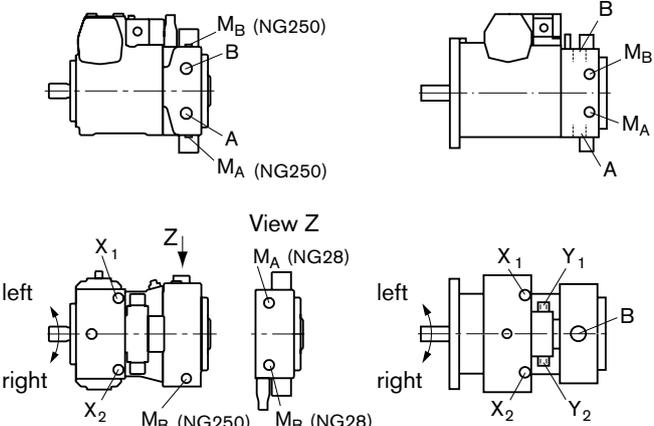

Check whether the application on your machine requires additional safety measures, in order to bring the driven actuator into a controlled and safe position (immediate stop). If necessary, make sure these are properly implemented.

Standard version¹⁾

Version with DA control valve¹⁾

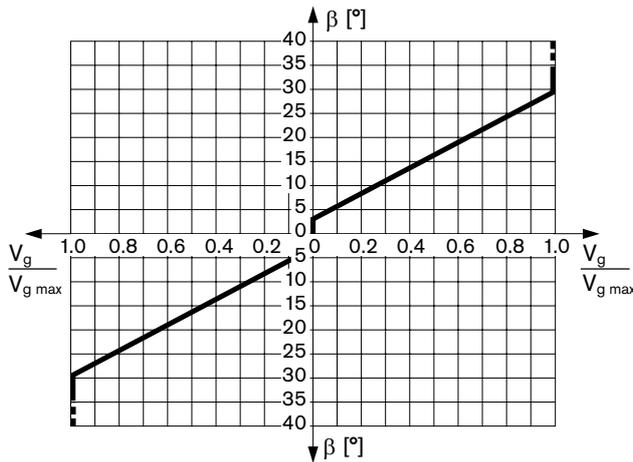

1) Sizes 28 and 250 without ports Fa1 and Fs

HW – Proportional control hydraulic, mechanical servo

The output flow of the pump is infinitely variable between 0 to 100 %, proportional to the swivel angle of the control lever between 0° and ±29° from the spring centered zero flow position.

A feedback lever, connected to the stroking piston maintains the pump flow for any given position of the control lever between 0° and 29°.

If the pump is also equipped with a DA control valve (see page 17), automotive operation is possible for travel drives.

Swivel angle β at the control lever for pump displacement change:

Beginning of control at $\beta = 3^\circ$

End of control at $\beta = 29^\circ$ (maximum displacement $V_{g \text{ max}}$)

Mechanical stop for β :

Size 28 to 71 _____ $\pm 40^\circ$
 Size 90 to 250 _____ $\pm 35^\circ$

The maximum required torque at the lever is 170 Ncm. To prevent damage to the HW control module, a positive mechanical stop must be provided for the HW control lever.

Note:

Spring centering enables the pump, depending on pressure and speed, to move automatically to the neutral position ($V_g = 0$) as soon as there is no longer any torque on the control lever of the HW control module (regardless of deflection angle).

Variation: neutral position switch

The switch contact in the neutral position switch is closed when the control lever on the HW control module is in its neutral position. The switch opens when the control lever is moved out of neutral in either direction.

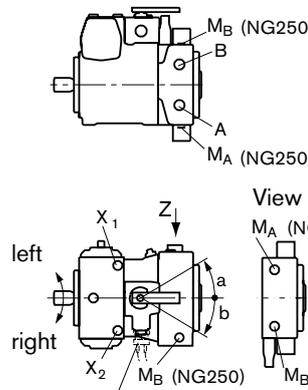

Thus, the neutral position switch provides a monitoring function for drive units that require the pump to be in the neutral position during certain operating conditions (e. g. starting diesel engines).

Technical data, neutral position switch	
Load capacity	20 A (continuous), w/o switching operating
Switching capacity	15 A / 32 V (resistive load) 4 A / 32 V (inductive load)
Connector design	DEUTSCH DT04-2P-EP04 (mating connector, see page 62)

¹⁾ Sizes 28 and 250 without ports F_{a1} and F_s

EP – Proportional control electric

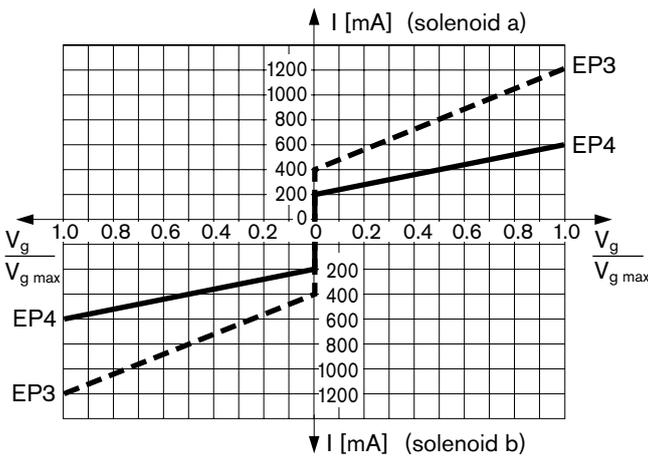

The output flow of the pump is infinitely variable between 0 to 100 %, proportional to the electrical current supplied to solenoid a or b.

The electrical energy is converted into a force acting on the spool of the control valve.

This valve spool then directs control oil into and out of the stroking cylinder to adjust pump displacement as required.

A feedback lever, connected to the stroking piston maintains the pump flow for any given current within the control range.

If the pump is also equipped with a DA control valve (see page 17), automotive operation is possible for travel drives.

Technical data, solenoid

	EP3	EP4
Voltage	12 V (±20 %)	24 V (±20 %)
Control current		
Beginning of control at $V_g = 0$	400 mA	200 mA
End of control at V_g_{max}	1200 mA	600 mA
Limiting current	1.54 A	0.77 A
Nominal resistance (at 20 °C)	5.5 Ω	22.7 Ω
Dither frequency	100 Hz	100 Hz
Duty cycle	100 %	100 %

Type of protection see connector design page 62

The following electronic controllers and amplifiers are available for controlling the proportional solenoids:

- BODAS controller RC
 - Series 20 _____ RE 95200
 - Series 21 _____ RE 95201
 - Series 22 _____ RE 95202
 - Series 30 _____ RE 95203, RE 95204
 and application software
- Analog amplifier RA _____ RE 95230

Further information can also be found on the Internet at www.boschrexroth.com/mobile-electronics.

Note

The spring return feature in the control module is not a safety device

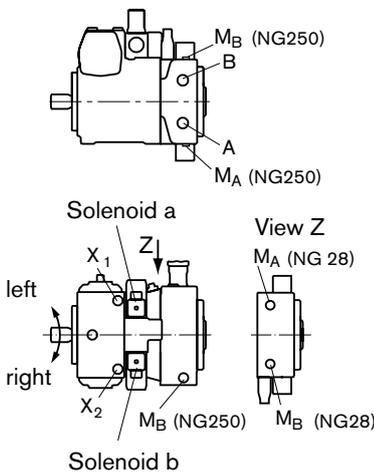

The control module can stick in an undefined position by internal contamination (contaminated hydraulic fluid, abrasion or residual contamination from system components). As a result, the control will no longer respond correctly to the operator's commands.

Check whether the application on your machine requires additional safety measures, in order to bring the driven actuator into a controlled and safe position (immediate stop). If necessary, make sure these are properly implemented.

DA – Automatic control speed-related

The DA closed loop control is an engine speed-dependent system for travel drives. The built-in DA control valve generates a control pressure which is proportional to pump (engine) drive speed. This control pressure is directed to the stroking cylinder of the pump by a solenoid actuated 4/3-way directional valve. The pump displacement is infinitely variable in each flow direction and is influenced by both pump drive speed and system pressure. The flow direction (e. g. machine moving forward or backward) is determined by either solenoid a or b being activated.

Increasing pump drive speed generates a higher control pressure from the DA control valve, with a subsequent increase in pump flow.

Depending on the selected pump operating characteristics, increasing system pressure (e. g. machine load) causes the pump to swivel back towards a smaller displacement. Engine overload protection (anti-stall) is achieved by the combination of this pressure-related pump de-stroking, and the reduction of control pressure as the engine speed drops.

Any additional power requirement, e. g. for hydraulic functions from attachments, could cause the engine speed to drop further. This would cause a further reduction in control pressure and thus of pump displacement. Automatic power distribution and full exploitation of the available power are achieved in this way, both for the travel drive and for the implement hydraulics, with priority given to the implement hydraulics.

Various override options are available for the DA control function to allow controlled operation of the implement hydraulics with high rpm at reduced vehicle speed.

The DA control valve can also be used in pumps with EP, DG, HW and HD control modules to protect the combustion engine against overload.

DA closed loop control is only suitable for certain types of drive systems and requires review of the engine and vehicle parameters to ensure that the pump is used correctly and that machine operation is safe and efficient. We recommend that all DA applications be reviewed by a Bosch Rexroth application engineer.

DA – Automatic control speed-related

Function and control of DA control valves

DA control valve fixed setting (2)

Control pressure is generated in relation to drive speed. When ordering, state in plain text: start of control (set at factory).

DA control valve mechanically adjustable with position lever (3)

Control pressure is generated in relation to drive speed. When ordering, state in plain text: start of control (set at factory).

Any reduction of the control pressure possible, independently of the drive speed, through mechanical actuation of the position lever (inch function).

The maximum permissible actuation torque at the position lever is $T_{\max} = 4 \text{ Nm}$.

Maximum angle of rotation 70° , lever position: any.

Version 3R

Actuating direction of the position lever: right

Version 3L

Actuating direction of the position lever: left

DA control valve fixed setting and braking inch valve mounted (4, 8)

(only for pumps with DA control module)

- Version with throttle valve size 28, 40, 56, 71
- Version with pressure reducing valve size 90, 125, 180, 250

Any reduction of the control pressure possible, independently of the drive speed via hydraulic control (port Z).

Version 4:

Control at port Z by means of brake fluid according to ISO 4925 (no mineral oil), from the vehicle braking system (hydraulically linked with the service brake).

Version 8:

Control at port Z by means of brake fluid based on mineral oil.

DA control valve fixed setting, ports for pilot control device as inch valve (7)

Any reduction of the pilot pressure possible, independently of the drive speed is achieved by the mechanical actuation of the pilot control device.

The pilot control device is installed separately from the pump (for example in the driver's cabin) and connected to the pump by two hydraulic control lines via ports P_S and Y.

A suitable pilot control device must be ordered separately and is not included in the delivery contents.

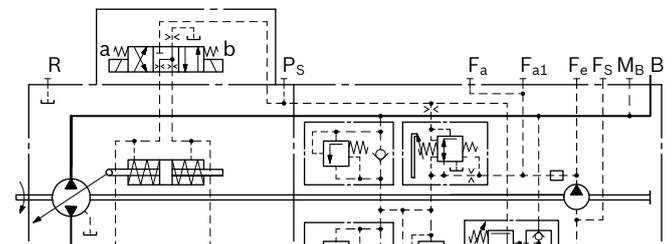

Detailed information is available from our sales department and on the Internet at www.boschrexroth.com/da-control. Use our computer program to work out the input design that meets your needs. All DA applications must be approved by a Bosch Rexroth application engineer.

Note: Rotary inch valves, see page 63.

F _S	Line from filter to suction line (cold start)	DIN 3852 ⁹⁾	M22 x 1.5; 14 deep	40	X
Y ₁ , Y ₂	Pilot signal (HD only)	DIN 3852 ⁹⁾	M14 x 1.5; 8 deep	40	O
Z	Inch signal (DA4 and 8 only)	DIN 3852 ⁹⁾	M10 x 1; 12 deep	40	X

1) ANSI B92.1a, 30° pressure angle, flat root, side fit, tolerance class 5

2) Center bore according to DIN 332 (thread according to DIN 13)

3) Observe the general instructions on page 68 for the maximum tightening torques.

4) Thread according to ASME B1.1

5) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

6) Only dimensions according to SAE J518, metric fastening thread is a deviation from standard.

7) Plugged with external supply.

8) Depending on installation position, T₁ or T₂ must be connected (see also installation instructions on pages 65 and 66).

9) The spot face can be deeper than specified in the appropriate standard.

10) Optional, see page 56

11) O = Must be connected (plugged on delivery)

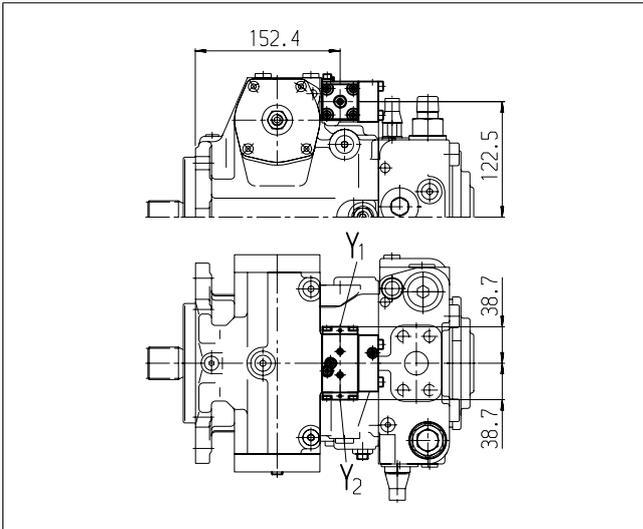

X = Plugged (in normal operation)

Dimensions size 71

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

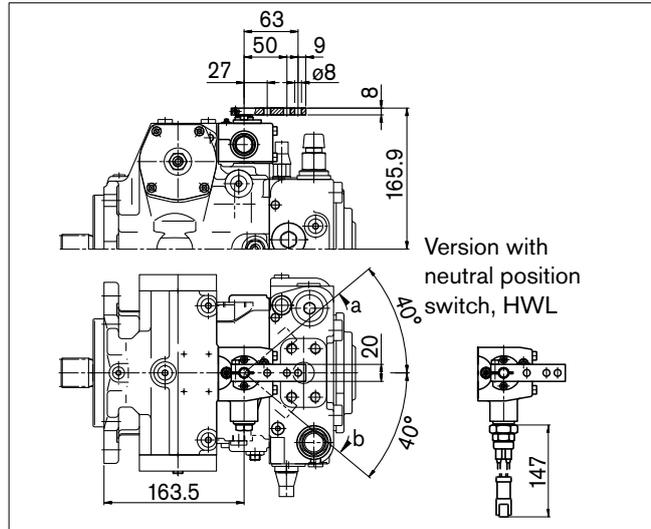

HD

Proportional control hydraulic, pilot-pressure related

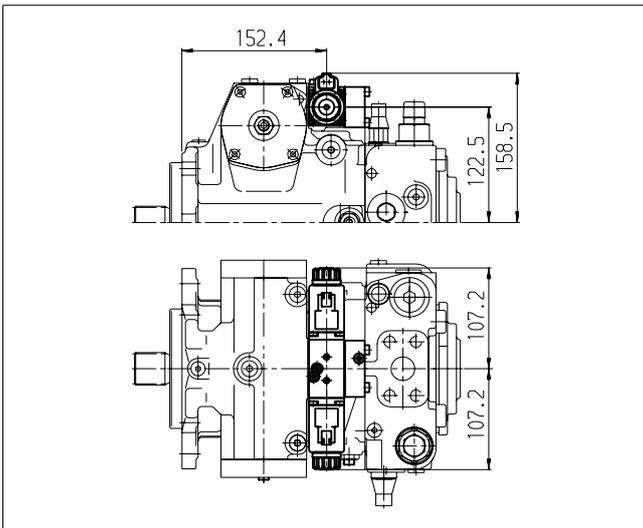

HW

Proportional control hydraulic, mechanical servo

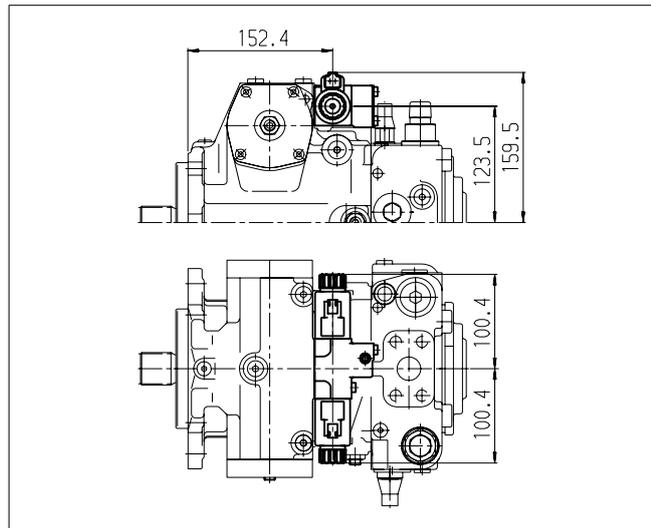

EP

Proportional control electric

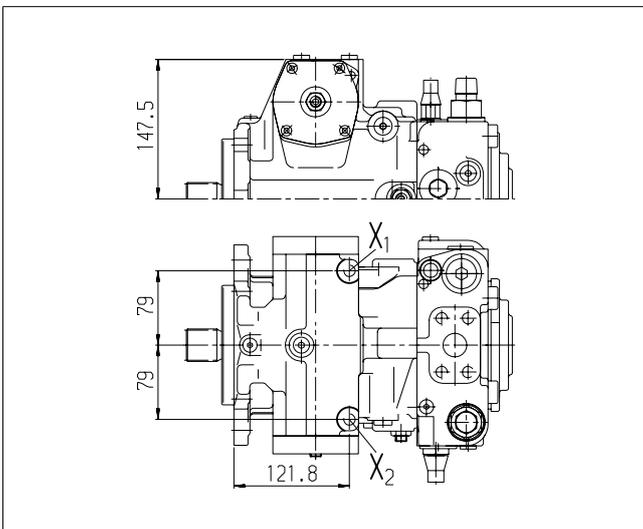

EZ

Two-point control electric

DG

Hydraulic control, direct controlled

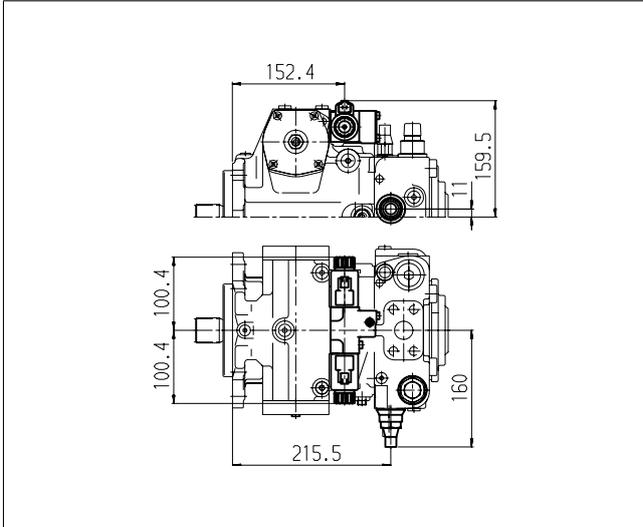

Dimensions size 71

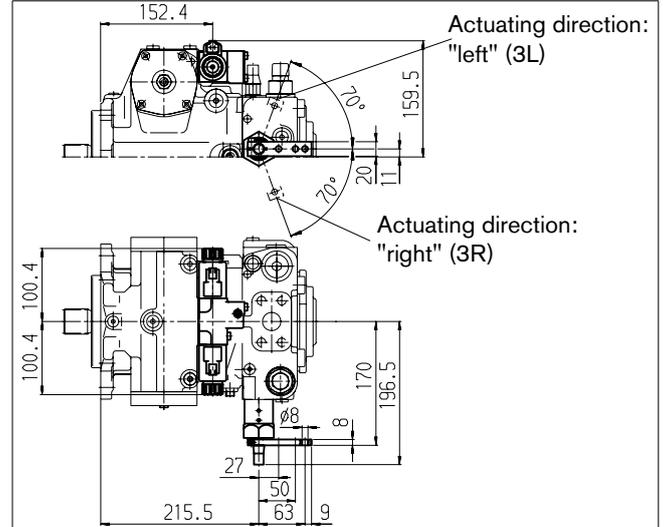

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

DA – control valve

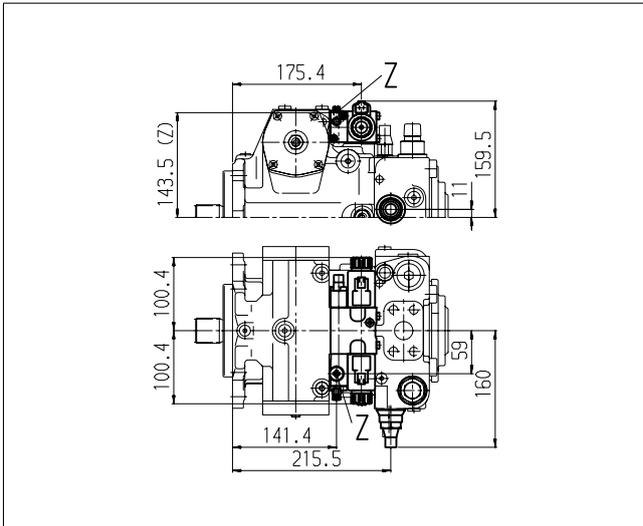

Version 2 – fixed setting

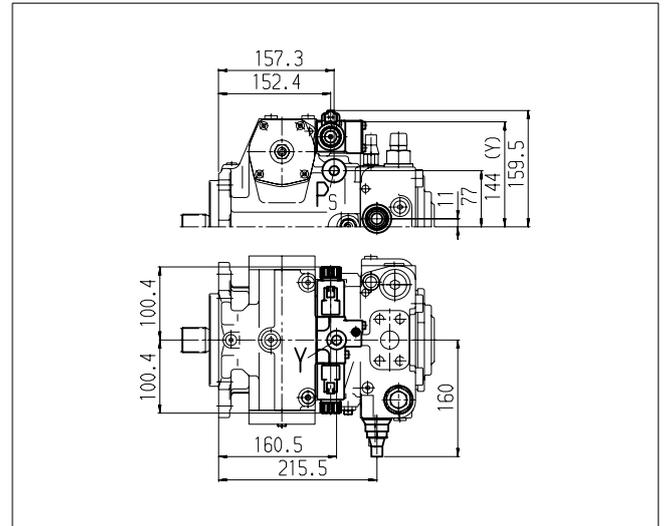

Version 3 – mechanically adjustable with position lever

Version 4/8 – fixed setting and inch valve mounted

Version 7 – fixed setting and ports for pilot control device

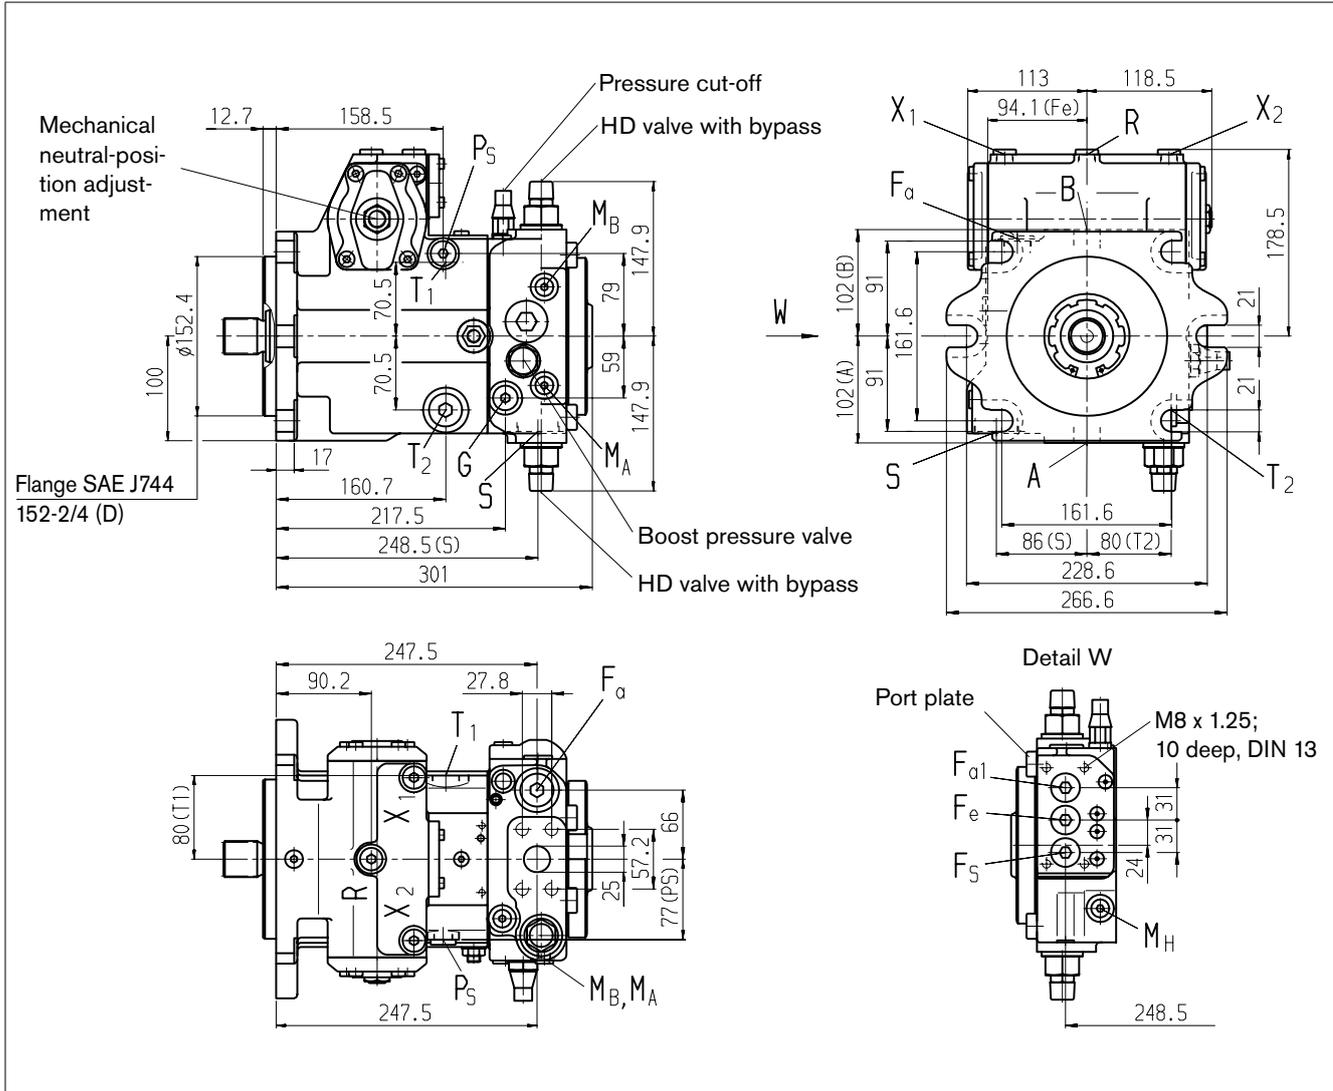

Dimensions size 90

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

NV – Version without control module

Standard: Suction port S at bottom (02)

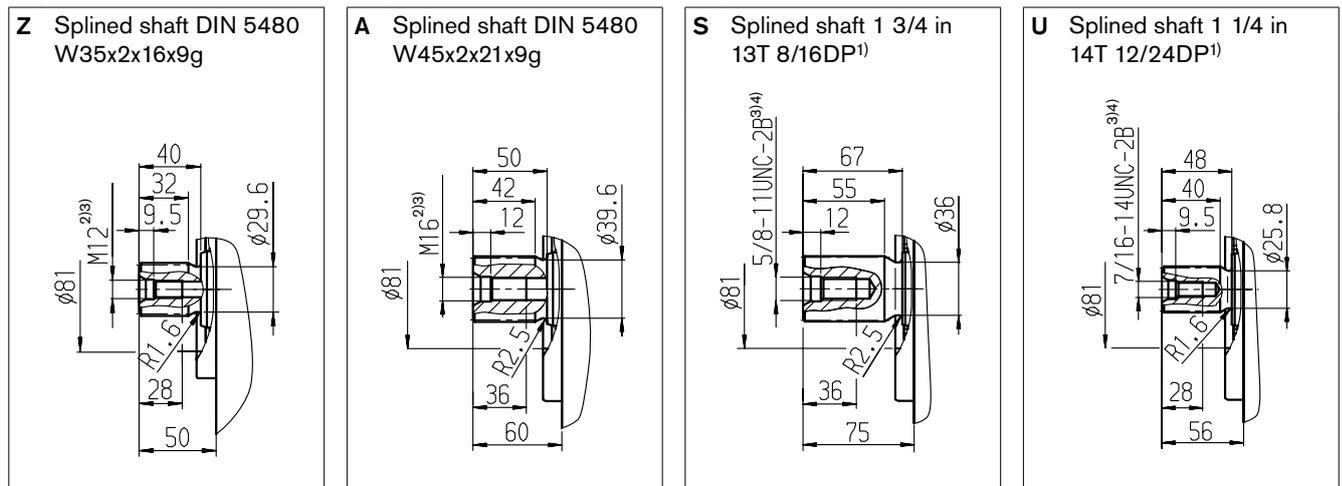

Option: Suction port S at top (03); port plate turned through 180°

Dimensions size 90

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

1) 2nd pump without through drive and with boost pump, F00

By using combination pumps, it is possible to have independent circuits without the need for splitter gearboxes.

When ordering combination pumps, the type designations of the 1st and 2nd pumps must be linked by a "+".

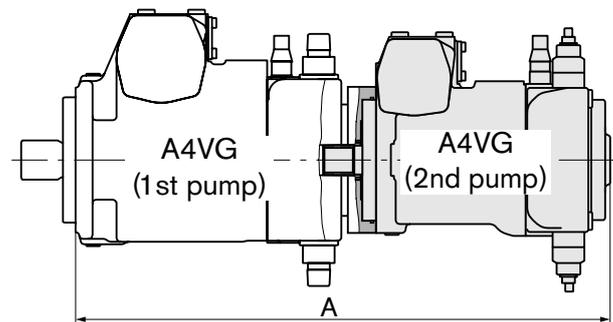

Ordering example:

A4VG56EP3D1/32R-NAC02F073SP + A4VG56EP3D1/32R-NSC02F003SP

A tandem pump consisting of two equal sizes is permissible without additional supports assuming that the dynamic acceleration does not exceed maximum 10 g (= 98.1 m/s²).

We recommend the use of the 4-hole mounting flanges for size 71 and larger.

For combination pumps consisting of more than two pumps, the mounting flange must be rated for the permissible mass torque.

High-pressure relief valves

The two high-pressure relief valves protect the hydrostatic transmission (pump and motor) from overload. They limit the maximum pressure in the respective high-pressure line and serve simultaneously as boost valves.

High-pressure relief valves are not working valves and are only suitable for pressure spikes or high rates of pressure change.

Setting ranges

High-pressure relief valve, direct controlled (size 28 to 56)	Differential pressure setting Δp_{HD}
Setting range for valve 3, 5 Δp 250 - 420 bar (see ordering code)	420 bar
	400 bar ¹⁾
	360 bar
	340 bar
	320 bar
	300 bar
	270 bar
	250 bar
Setting range for valve 4, 6 Δp 100 - 250 bar (see ordering code)	250 bar
	230 bar ¹⁾
	200 bar
	150 bar
	100 bar
High-pressure relief valve, pilot operated (size 71 to 250)	Differential pressure setting Δp_{HD}
	420 bar
	400 bar ¹⁾
	360 bar
	340 bar
	320 bar
	300 bar
	270 bar
	250 bar
	230 bar
	200 bar
	150 bar
	100 bar

1) Standard differential pressure setting. If not specified in the order, valves will be set to this value.

When ordering, state in plain text:

(only the Δp_{HD} values stated in the table are possible)

High-pressure relief valve A

Differential pressure setting _____ $\Delta p_{HD} = \dots$ bar

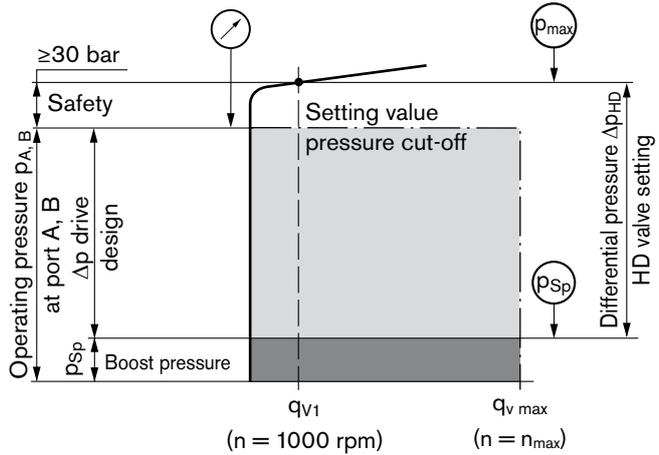

Cracking pressure of the HD valve (at q_{V1}) _____ $p_{max} = \dots$ bar
($p_{max} = \Delta p_{HD} + p_{Sp}$)

High-pressure relief valve B

Differential pressure setting _____ $\Delta p_{HD} = \dots$ bar

Cracking pressure of the HD valve (at q_{V1}) _____ $p_{max} = \dots$ bar
($p_{max} = \Delta p_{HD} + p_{Sp}$)

Setting diagram

Note

The valve settings are made at $n = 1000$ rpm and at $V_{gmax}(q_{V1})$. There may be deviations in the cracking pressures with other operating parameters.

Example:

Operating pressure $p_{A,B}$ _____ 400 bar
 Boost pressure p_{Sp} _____ 30 bar
 Differential pressure Δp_{HD} _____ 400 bar

$$p_{A,B} - p_{Sp} + \text{Safety} = \Delta p_{HD}$$

$$400 \text{ bar} - 30 \text{ bar} + 30 \text{ bar} = 400 \text{ bar}$$

Bypass function

A connection between the two high-pressure channels A and B can be established using the bypass valve (e.g. for machine towing).

Towing speed

The maximum towing speed is dependent on the gear ratio in the vehicle and must be calculated by the vehicle manufacturer. The corresponding flow of $Q = 30$ L/min must not be exceeded.

Towing distance

The vehicle may only be towed out of the immediate danger zone.

Note:

The bypass function and the pilot-controlled high pressure relief valves (size 71 to 250) are not illustrated in the circuit diagrams.

Pressure cut-off

The pressure cut-off is a pressure control which, after reaching the set pressure, adjusts the displacement of the pump back to $V_{g \text{ min}}$.

This valve prevents the operation of the high-pressure relief valves when accelerating or decelerating.

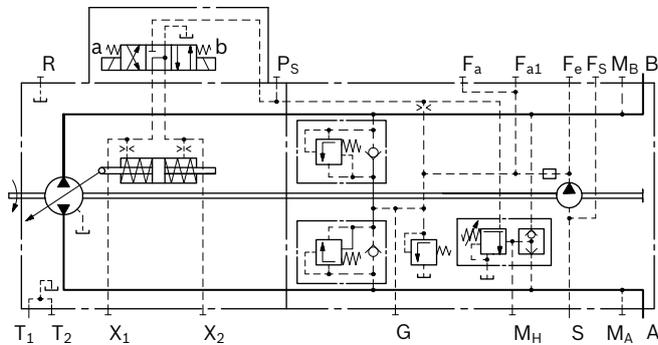

The high-pressure relief valves protect against the pressure spikes which occur during fast swiveling of the swashplate and limit the maximum pressure in the system.

The setting range of the pressure cut-off may be anywhere within the entire operating pressure range. However, it must be set 30 bar lower than the setting of the high-pressure relief valves (see setting diagram, page 54).

Please state the setting value of the pressure cut-off in plain text when ordering.

Schematic with pressure cut-off

Example: two-point control electric, EZ1D/EZ2D

Mechanical stroke limiter

The mechanical stroke limiter is an auxiliary function allowing the maximum displacement of the pump to be steplessly reduced, regardless of the control module used.

With two threaded pins, the stroke of the stroke piston and thus the maximum swivel angle of the pump is limited.

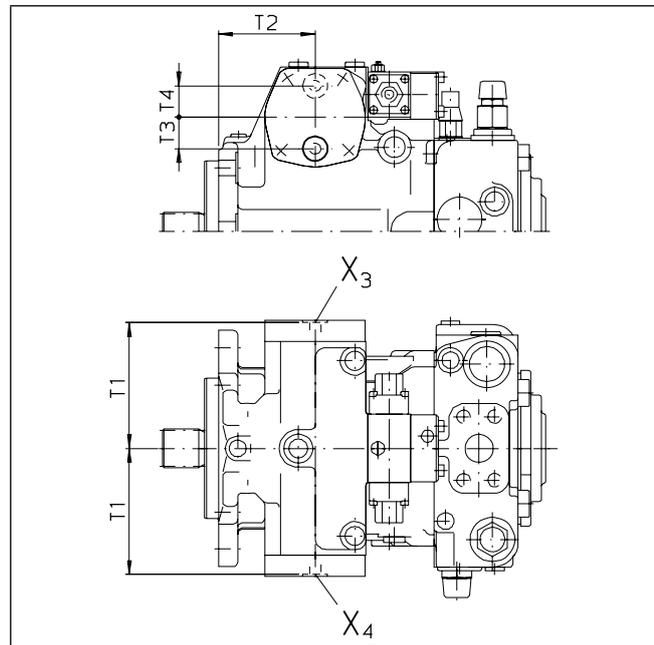

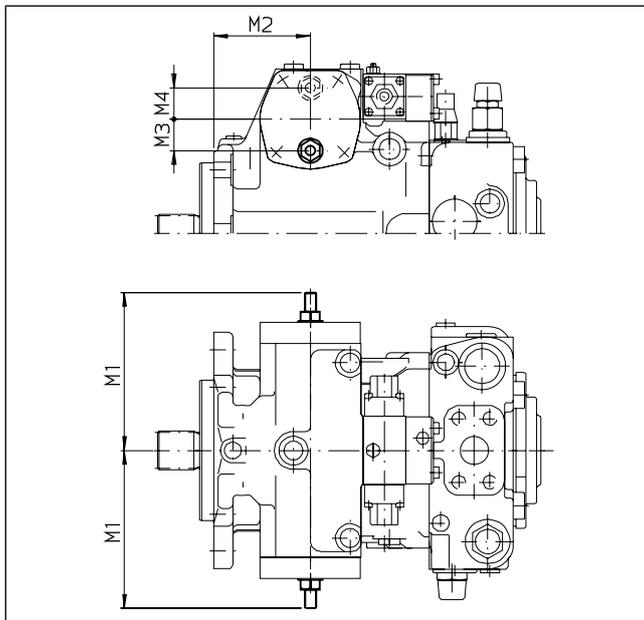

Dimensions

X ₃ , X ₄	Stroking chamber pressure (size 250 only)	DIN 3852	M16 x 1.5; 12 deep	40	X

1) Sizes 28 and 250 without ports F_{a1} and F_S

2) The spot face can be deeper than specified in the appropriate standard.

3) Observe the general instructions on page 68 for the maximum tightening torques.

4) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

5) X = Plugged (in normal operation)

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Filtration boost circuit / external supply

Version S (standard)

Filtration in the suction line of the boost pump

Standard version (preferred)

Filter type _____ filter **without** bypass

Recommendation _____ **with** contamination indicator

Recommended differential pressure at filter cartridge

At $v = 30 \text{ mm}^2/\text{s}$, $n = n_{\text{max}}$ _____ $\Delta p \leq 0.1 \text{ bar}$

At $v = 1000 \text{ mm}^2/\text{s}$, $n = n_{\text{max}}$ _____ $\Delta p \leq 0.3 \text{ bar}$

Pressure at suction port S:

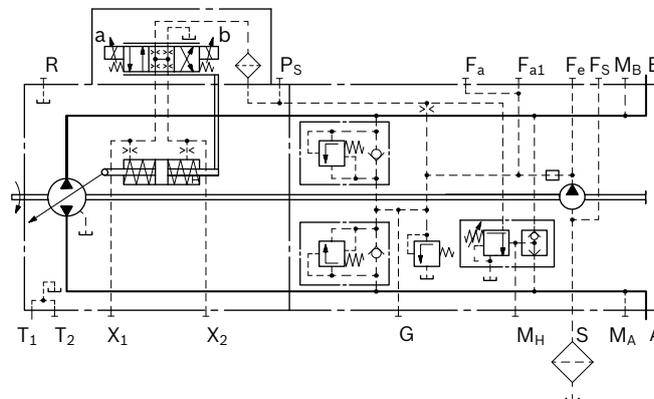

Continuous $p_{S \text{ min}}$ ($v \leq 30 \text{ mm}^2/\text{s}$) _____ $\geq 0.8 \text{ bar absolute}$

Short-term, on cold start ($t < 3 \text{ min}$) _____ $\geq 0.5 \text{ bar absolute}$

Maximum $p_{S \text{ max}}$ _____ $\leq 5 \text{ bar absolute}$

The filter is not included in the delivery contents.

Schematic version S (standard)

Version E

External supply

This variation should be used in versions **without** integrated boost pump (N00 or K..).

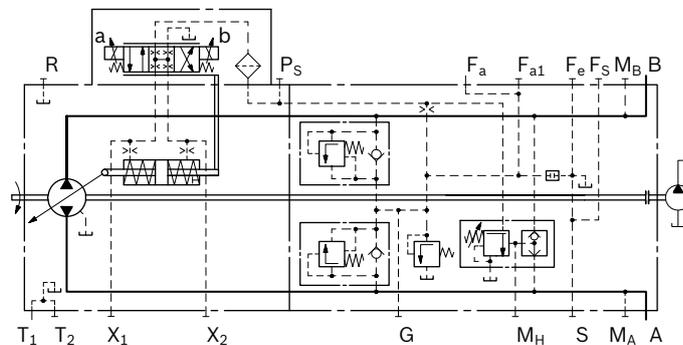

Port S is plugged.

Supply comes from port F_a .

Filter arrangement _____ separate

To ensure the functional reliability, maintain the required cleanliness level for the boost fluid fed in at port F_a (see page 6).

Schematic version E

Version D

Filtration in the pressure line of the boost pump, ports for external boost circuit filter

Boost pressure inlet _____ port F_a

Boost pressure outlet _____ port F_e

Filter type _____

Filter with bypass are **not recommended**. For applications with bypass please contact us.

Recommendation _____ **with** contamination indicator

Note

For versions with **DG** control (with pilot pressure not from boost circuit), the following filter type should be used:

Filter **with** bypass and **with** contamination indicator

Filter arrangement _____

Separate in the pressure line (inline filter)

Permissible differential pressure at filter cartridge

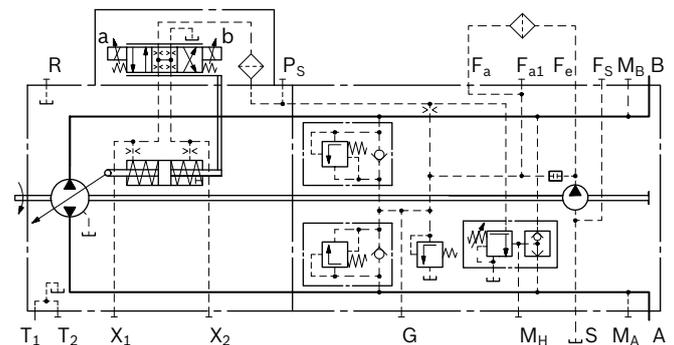

At $v = 30 \text{ mm}^2/\text{s}$ _____ $\Delta p \leq 1 \text{ bar}$

At cold start _____ $\Delta p \leq 3 \text{ bar}$

(valid for entire speed range $n_{\text{min}} - n_{\text{max}}$)

The filter is not included in the delivery contents.

Schematic version D

Filtration boost circuit / external supply

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Version K

Filtration in the pressure line of the boost pump, with cold start valve and ports for external boost circuit filter

Version as version D, but with additional cold start valve.

The port plate is equipped with **cold start valve** and thereby protects the system from damage.

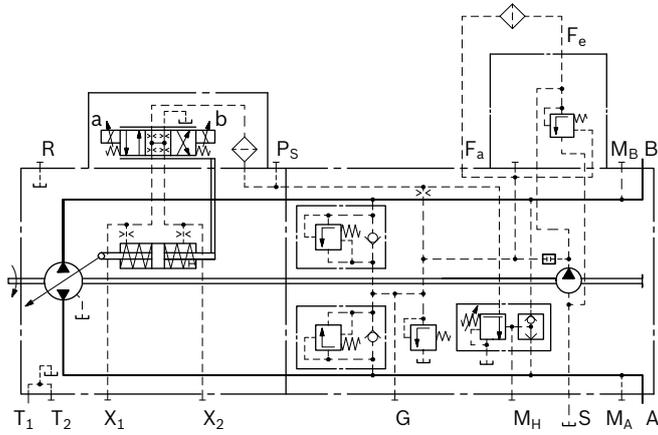

The valve opens at a differential pressure $\Delta p \geq 6$ bar.

Boost pressure inlet _____ port F_a
 Boost pressure outlet _____ port F_e

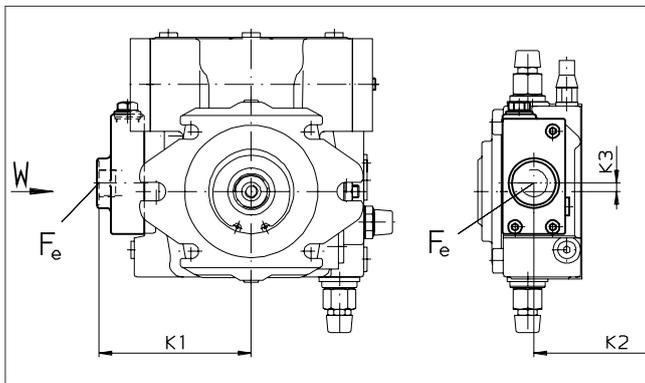

Filter arrangement ___ separate in the pressure line (inline filter)

The filter is not included in the delivery contents.

Schematic version K (with cold start valve)

Dimensions, version K (with cold start valve)

NG	K1	K2	K3	$F_e^{1) 2)}$
40	122.5	198.7	0	M18 x 1.5; 15 deep
56	125.5	215.4	0	M18 x 1.5; 15 deep

90	139.5	248.5	24	M26 x 1.5; 16 deep
125	172.0	267.9	20	M33 x 2; 18 deep
180	173.0	311.9	3	M33 x 2; 18 deep

- 1) Thread according to DIN 3852, observe the general instructions on page 68 for the maximum tightening torques.
- 2) The spot face can be deeper than specified in the appropriate standard.

Version F

Filtration in the pressure line of the boost pump, filter mounted

Filter type _____ filter **without** bypass

Filtration grade (absolute) _____ 20 microns

Filter material _____ glass fiber

Pressure rating _____ 100 bar

Filter arrangement _____ mounted on pump

The filter is equipped with **cold start valve** and thereby protects the system from damage.

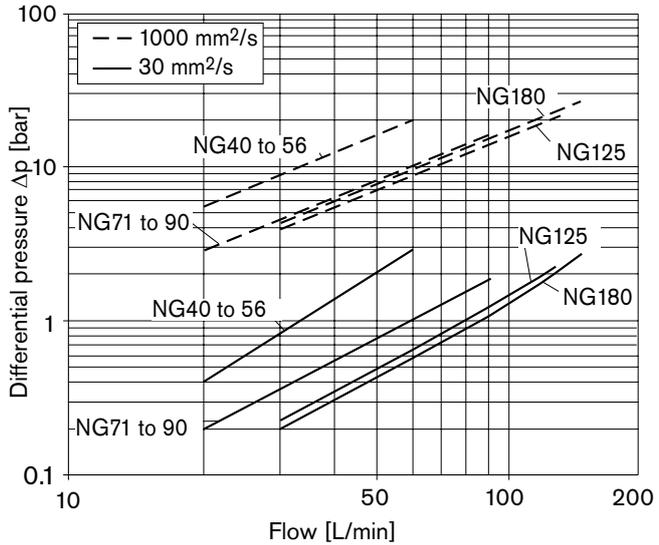

The valve opens at a differential pressure $\Delta p \geq 6$ bar.

Recommendation

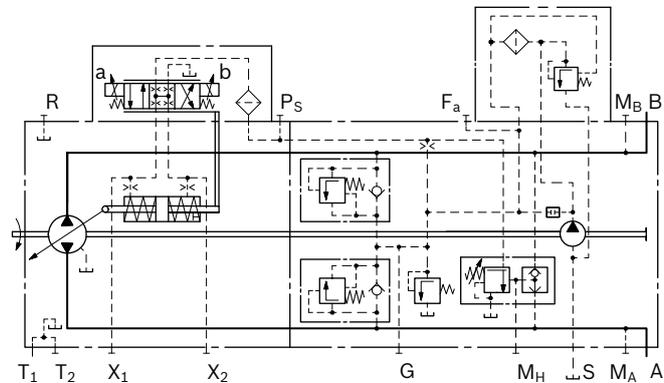

With contamination indicator (version P, B)
 (differential pressure $\Delta p = 5$ bar)

Filter characteristics

Differential pressure/flow characteristics to ISO 3968 (valid for clean filter cartridge).

Schematic version F (with filter)

Filtration boost circuit / external supply

Version P

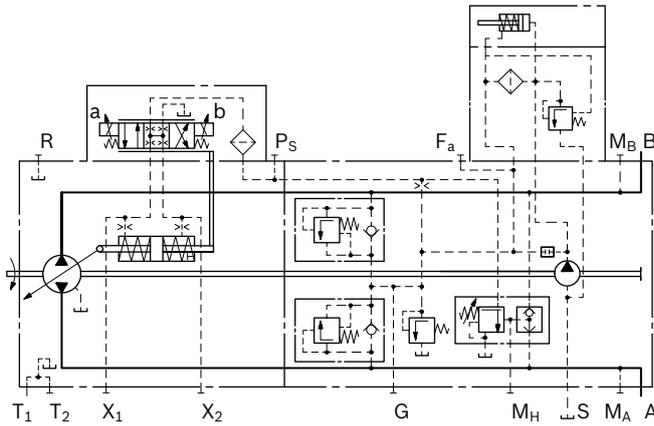

Filtration in the pressure line of the boost pump, filter mounted, with visual contamination indicator

Version similar to variation F, however additionally with visual contamination indicator.

Indication _____ Green/red window

Differential pressure (switching pressure) _____ $\Delta p = 5 \text{ bar}$

Schematic version P

Version B

Filtration in the pressure line of the boost pump, filter mounted, with electric contamination indicator

Filtration similar to variation F, however additionally with electric contamination indicator.

Indication _____ electric

Connector design _____ DEUTSCH DT04-2P-EP04 (mating connector, see page 62)

Differential pressure (switching pressure) _____ $\Delta p = 5 \text{ bar}$

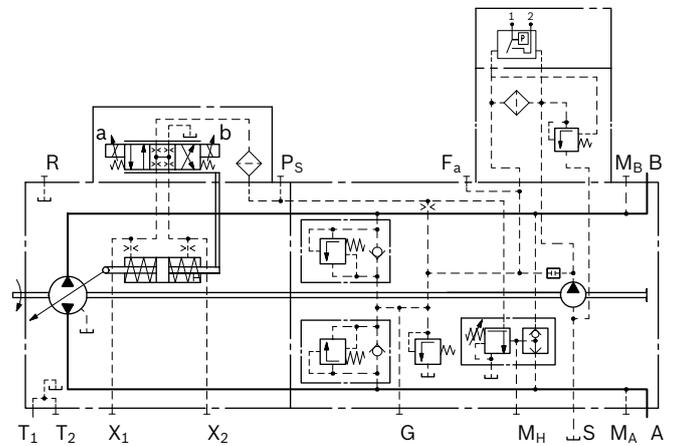

Maximum switching capacity at

12 V DC _____ 36 W

24 V DC _____ 72 W

Type of protection: IP 67 _____ DIN/EN 60529

Schematic version B

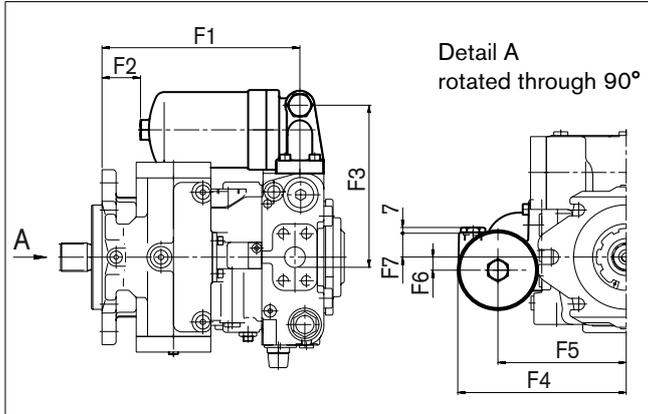

Filtration boost circuit / external supply

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Dimensions with filter fitted

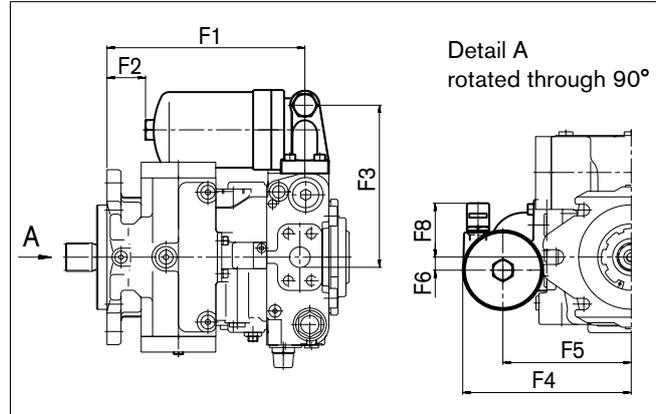

Version F

Filter mounted without contamination indicator

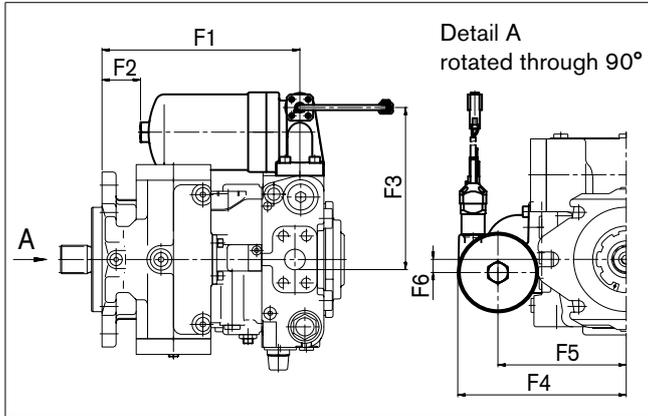

Version P

Filter mounted with contamination indicator with window

Version B

Filter mounted with electric contamination indicator

Swivel angle sensor

For the swivel angle indicator, the pump swivel angle is measured by an electric swivel angle sensor.

As an output parameter, the Hall-effect swivel angle sensor delivers a voltage proportional to the swivel angle (see table of output voltages).

Please contact us if the swivel angle sensor is used for control.

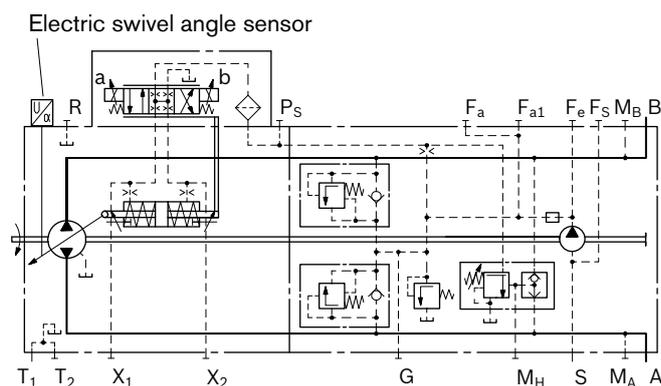

Characteristics

Supply voltage U_b	10 to 30 V DC		
Output voltage U_a	0.5 V ($V_{g\ max}$)	2.5 V ($V_{g\ 0}$)	4.5 V ($V_{g\ max}$)
Reverse voltage protection	Short circuit-resistant		
EMC resistance	Details on request		
Operating temperature range	-40 °C to +115 °C		
Vibration resistance sinusoidal vibration EN 60068-2-6	10 g / 5 to 2000 Hz		
Shock resistance continuous shock IEC 68-2-29	25 g		
Resistance to salt spray (DIN 50 021-SS)	96 h		
Type of protection with mounted mating connector	IP67 – DIN/EN 60529	IP69K – DIN 40050-9	
Housing material	Plastic

Mating connector

AMP Superseal 1.5; 3-pin
Bosch Rexroth Mat. No. R902602132

- Consisting of: AMP No.
- 1 socket case, 3-pins _____ 282087-1
 - 3 single wire seals, yellow _____ 281934-2
 - 3 socket contacts 1.8 - 3.3 mm _____ 283025-1

The mating connector is not included in the delivery contents. This can be supplied by Bosch Rexroth on request.

Connector for solenoids

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

DEUTSCH DT04-2P-EP04

Molded, 2-pin, without bidirectional suppressor diode (standard) _____ **P**

Molded, 2-pin, with bidirectional suppressor diode (only for switching solenoid on control module EZ1/2, DA) ___ **Q**

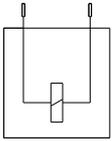

There is the following type of protection with mounted mating connector:

IP67 _____ DIN/EN 60529
and IP69K _____ DIN 40050-9

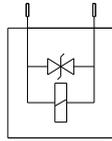

The protection circuit with bidirectional suppressor diode is needed to limit overvoltages. Overvoltages are caused by switching off the current with switches, relay contacts or by disconnecting the mating connector while voltage is applied.

Circuit symbol

Without bidirectional suppressor diode

with bidirectional suppressor diode

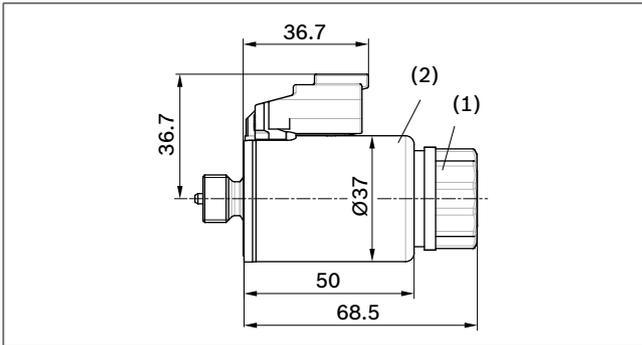

Mating connector

DEUTSCH DT06-2S-EP04
Bosch Rexroth Mat. No. R902601804

Consisting of: _____ DT designation
– 1 housing _____ DT06-2S-EP04
– 1 wedge _____ W2S
– 2 sockets _____ 0462-201-16141

The mating connector is not included in the delivery contents. This can be supplied by Bosch Rexroth on request.

Changing connector orientation

If necessary, you can change the connector orientation by turning the solenoid housing.

To do this, proceed as follows:

1. Loosen the mounting nut (1) of the solenoid. To do this, turn the mounting nut (1) one turn counter-clockwise.
2. Turn the solenoid body (2) to the desired orientation.
3. Retighten the mounting nut. Tightening torque: 5+1 Nm. (WAF26, 12-sided DIN 3124)

On delivery, the connector orientation may differ from that shown in the brochure or drawing.

Rotary inch valve

Any reduction of the pilot pressure possible, independently of the drive speed, through mechanical actuation of the position lever. Maximum angle of rotation 90°, lever position: any.

The valve is arranged separately from the pump and is connected to the pump by a hydraulic control line via port P_S (maximum line length: approx. 2 m).

The rotary inch valve must be ordered separately.

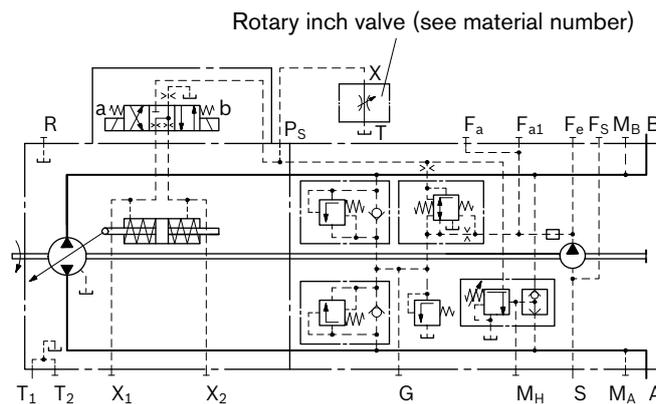

NG	Material No.	Actuating direction of the position lever
28, 40, 56, 71, 90	R902048734 R902048735	right left
125	R902048740 R902048741	right left
180, 250	R902048744 R902048745	right left

Note:

The rotary inch valve can be used regardless of the control module.

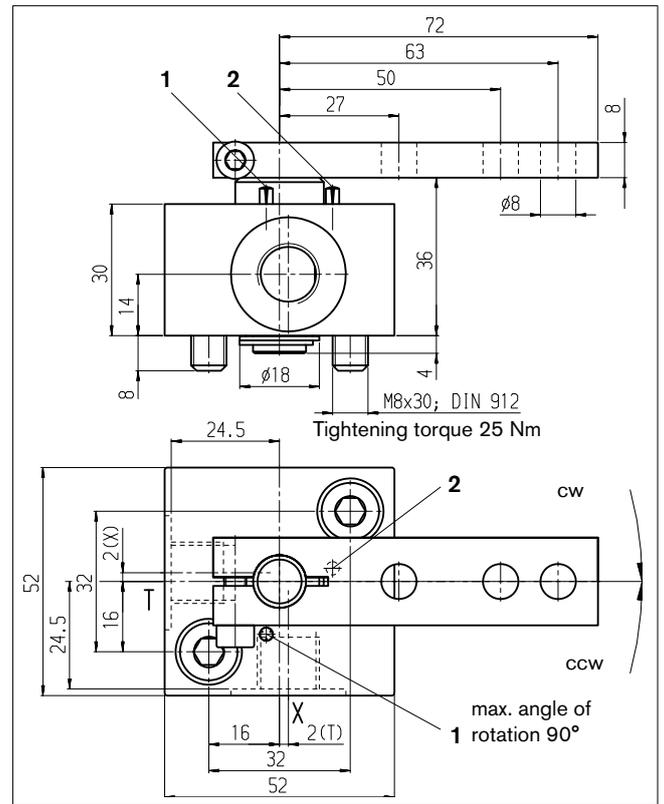

Schematic:

Hydraulic control, speed-related, DA with separately attached rotary inch valve

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

Dimensions

Note

Limitation 1 and 2 are function stops for inching. They are not to be used as a mechanical limitation within the system. We recommend limiting the angle of rotation to 85° within the system.

Designation	Port for	Standard	Size ¹⁾	Maximum pressure [bar] ²⁾	State ³⁾
X	Pilot pressure	DIN 3852	M14 x 1.5; 12 deep	40	O
T	Drain line	DIN 3852	M14 x 1.5; 12 deep	3	O

1) Observe the general instructions on page 68 for the maximum tightening torques.

2) Momentary pressure spikes may occur depending on the application. Keep this in mind when selecting measuring devices and fittings.

3) O = Must be connected (plugged on delivery)
X = Plugged (in normal operation)

Installation dimensions for coupling assembly

Before finalizing your design, request a binding installation drawing. Dimensions in mm.

To ensure that rotating components (coupling hub) and fixed components (housing, circlip) do not come into contact with each other, the installation conditions described here must be observed. This depends on the pump size and the splined shaft.

Size 28 and 40 (with free turning):

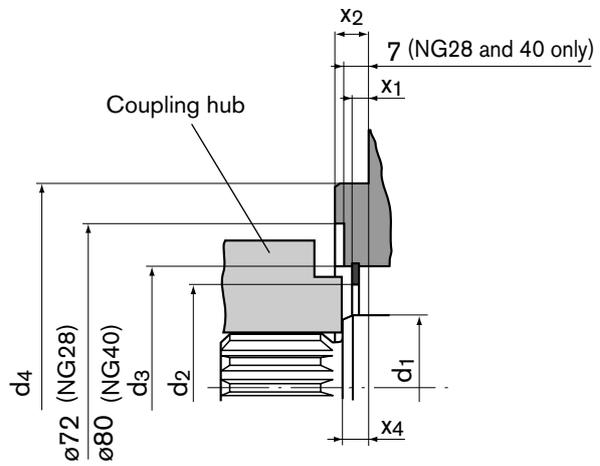

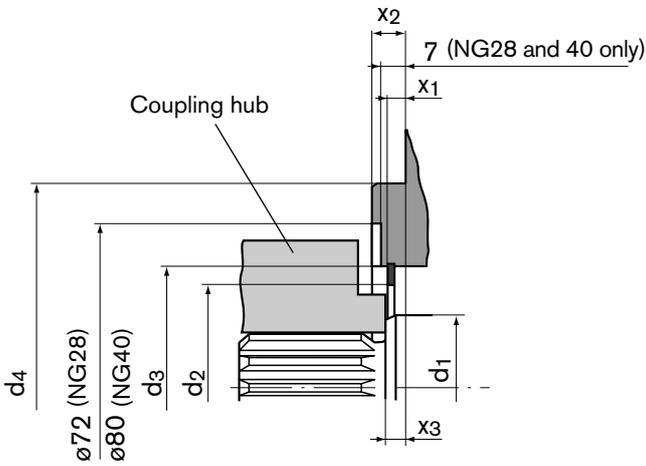

- SAE and DIN splined shaft
Note diameter of free turning (size 28: $\varnothing 72$, size 40: $\varnothing 80$).

Size 56 to 250 (without free turning):

- SAE splined shaft (shaft S or T)
The outer diameter of the shoulder on coupling hub must be smaller than the inner diameter of the circlip d_2 in the area near the drive shaft collar (dimension $x_2 - x_3$).
- DIN splined shaft (shaft Z or A)
The outer diameter of the shoulder on coupling hub must be smaller than the case diameter d_3 in the area near the drive shaft collar (dimension $x_2 - x_4$).

SAE splined shaft (splines according to ANSI B92.1a)

DIN splined shaft (splines according to DIN 5480)

NG	$\varnothing d_1$	$\varnothing d_{2 \text{ min}}$	$\varnothing d_3$	$\varnothing d_4$	x_1	x_2	x_3	x_4

Installation instructions

General

During commissioning and operation, the axial piston unit must be filled with hydraulic fluid and air bled. This must also be observed following a relatively long standstill as the axial piston unit may drain back to the reservoir via the hydraulic lines.

Particularly in the installation position "drive shaft upwards" filling and air bleeding must be carried out completely as there is, for example, a danger of dry running.

The case drain fluid in the pump housing must be directed to the reservoir via the highest available drain port (T₁, T₂).

For combinations of multiple units, make sure that the respective case pressure in each unit is not exceeded. In the event of pressure differences at the drain ports of the units, the shared drain line must be changed so that the minimum permissible case pressure of all connected units is not exceeded in any situation. If this is not possible, separate drain lines must be laid if necessary.

To achieve favorable noise values, decouple all connecting lines using elastic elements and avoid above-reservoir installation.

In all operating conditions, the suction and drain lines must flow into the reservoir below the minimum fluid level. The permissible suction height h_S results from the overall loss of pressure; it must not, however, be higher than $h_{S\ max} = 800\ mm$. The minimum suction pressure at port S must also not fall below 0.8 bar absolute during operation (cold start 0.5 bar absolute).

Installation position

See the following examples 1 to 12. Further installation positions are available upon request.

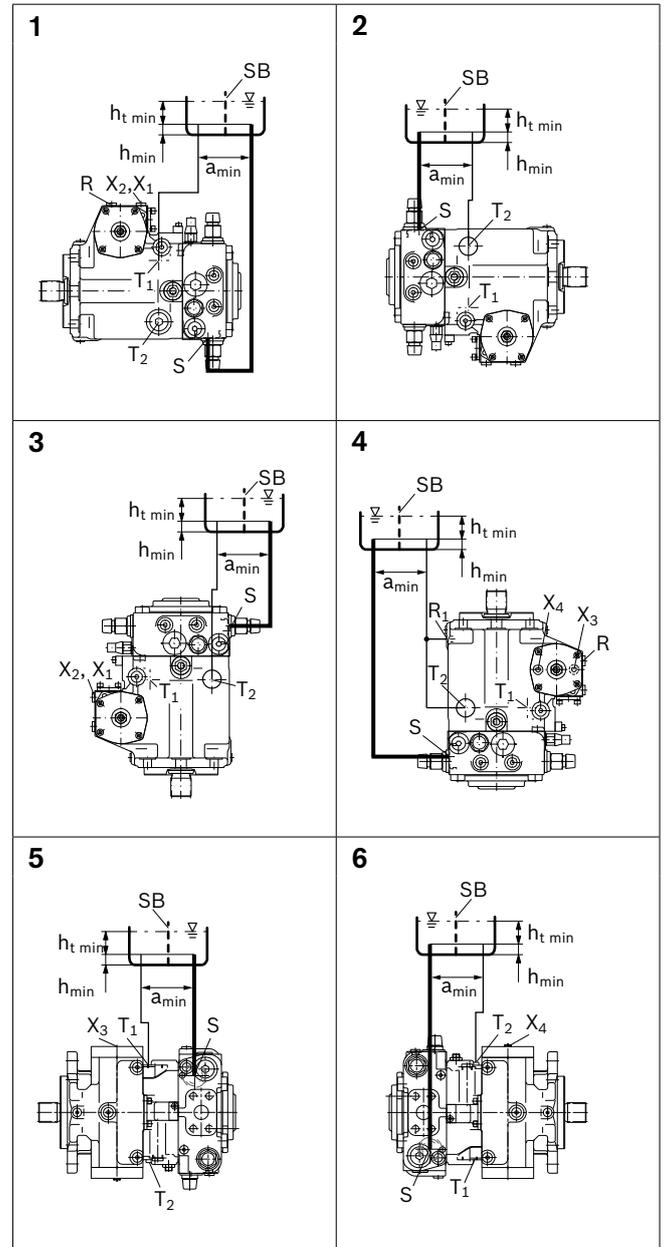

Recommended installation positions: 1 and 2.

Notes

- Size 71 to 250
With the "drive shaft upwards" installation position, an R₁-port is necessary (special version).
- If it is not possible to fill the stroking chambers via X₁ to X₄ in the final installation position, this must be done prior to installation.
- To prevent unexpected actuation and damage, the stroking chambers must be bled via the ports X₁, X₂ or X₃, X₄ depending on the installation position.
- In certain installation positions, an influence on the control characteristics can be expected. Gravity, dead weight and case pressure can cause minor shifts in control characteristics and changes in response time.

Below-reservoir installation (standard)

Below-reservoir installation means that the axial piston unit is installed outside of the reservoir below the minimum fluid level.

Installation position	Bleeding the case	Bleeding the stroking chamber	Filling
1	R	X ₁ , X ₂	S + T ₁ + X ₁ + X ₂
2	-	-	S + T ₂
3	-	X ₁ , X ₂	S + T ₂ + X ₁ + X ₂
4	R ₁	X ₃ , X ₄	S + T ₂ + X ₃ + X ₄
5	-	X ₃	S + T ₁ + X ₃
6	-	X ₄	S + T ₂ + X ₄

Note instructions!

Key, see page 64.

Installation instructions

Above-reservoir installation

Above-reservoir installation means that the axial piston unit is installed above the minimum fluid level of the reservoir.

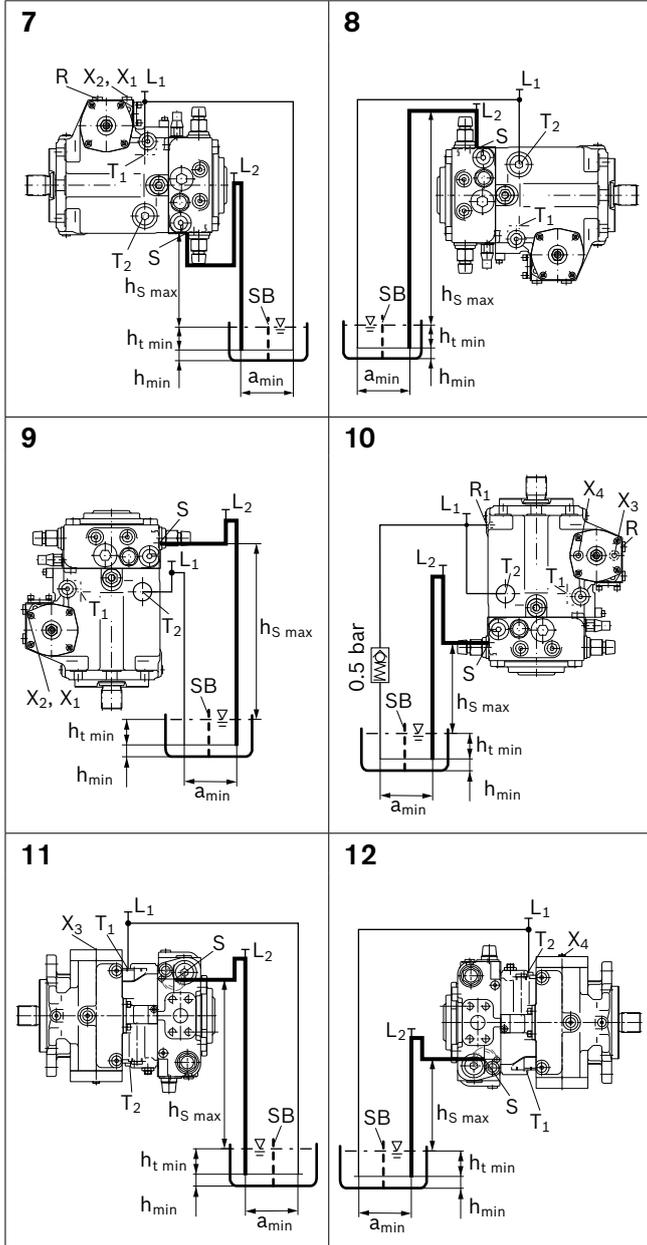

Observe the maximum permissible suction height $h_{S\ max} = 800\ mm$.

Recommendation for installation position 10 (drive shaft upward): A check valve in the drain line (cracking pressure 0.5 bar) can prevent draining of the pump housing.

Installation position	Bleeding the case	Bleeding the stroking chamber	Filling
7	$L_2 + R$	X_1, X_2	$L_1 + L_2 + X_1 + X_2$
8	$L_2 (S) + L_1 (T_2)$	–	$L_2 (S) + L_1 (T_2)$
9	$L_2 (S) + L_1 (T_2)$	X_1, X_2	$L_2 (S) + L_1 (T_2) + X_1 + X_2$
10	$L_2 + R_1$	X_3, X_4	$L_1 + L_2 + X_3 + X_4$
11	$L_2 (S) + L_1 (T_1)$	X_3	$L_2 (S) + L_1 (T_1) + X_3$
12	$L_2 (S) + L_1 (T_2)$	X_4	$L_2 (S) + L_1 (T_2) + X_4$

Comply with notes on page 65!

- L₁, L₂** Filling / air bleed
- R** Air bleed port
- S** Suction port
- T₁, T₂** Drain port
- SB** Baffle (baffle plate)
- h_{t min}** Minimum required immersion depth (200 mm)
- h_{min}** Minimum required spacing to reservoir bottom (100 mm)
- h_{S max}** Maximum permissible suction height (800 mm)
- a_{min}** When designing the reservoir, ensure adequate space between the suction line and the drain line. This prevents the heated, return flow from being drawn directly back into the suction line.

Notes

General instructions

- The pump A4VG is designed to be used in closed circuit.
- The project planning, installation and commissioning of the axial piston unit requires the involvement of qualified personnel.
- Before using the axial piston unit, please read the corresponding instruction manual completely and thoroughly. If necessary, these can be requested from Bosch Rexroth.
- During and shortly after operation, there is a risk of burns on the axial piston unit and especially on the solenoids. Take appropriate safety measures (e. g. by wearing protective clothing).
- Depending on the operating conditions of the axial piston unit (operating pressure, fluid temperature), the characteristic may shift.
- Service line ports:
 - The ports and fastening threads are designed for the specified maximum pressure. The machine or system manufacturer must ensure that the connecting elements and lines correspond to the specified application conditions (pressure, flow, hydraulic fluid, temperature) with the necessary safety factors.
 - The service line ports and function ports can only be used to accommodate hydraulic lines.
- The data and notes contained herein must be adhered to.
- The product is not approved as a component for the safety concept of a general machine according to ISO 13849.
- The following tightening torques apply:
 - Fittings:
 - Observe the manufacturer's instructions regarding the tightening torques of the fittings used.
 - Mounting bolts:
 - For mounting bolts with metric ISO thread according to DIN 13 or thread according to ASME B1.1, we recommend checking the tightening torque in individual cases in accordance with VDI 2230.
 - Female threads in the axial piston unit:
 - The maximum permissible tightening torques $M_{G \max}$ are maximum values of the female threads and must not be exceeded. For values, see the following table.
 - Threaded plugs:
 - For the metallic threaded plugs supplied with the axial piston unit, the required tightening torques of threaded plugs M_V apply. For values, see the following table.

Ports		Maximum permissible tightening torque of the female threads $M_{G \max}$	Required tightening torque of the threaded plugs $M_V^{1)}$	WAF hexagon socket of the threaded plugs
Standard	Size of thread			
DIN 3852	M10 x 1	30 Nm	15 Nm ²⁾	5 mm
	M12 x 1.5	50 Nm	25 Nm ²⁾	6 mm
	M14 x 1.5	80 Nm	35 Nm	6 mm
	M16 x 1.5	100 Nm	50 Nm	8 mm
	M18 x 1.5	140 Nm	60 Nm	8 mm
	M22 x 1.5	210 Nm	80 Nm	10 mm
	M26 x 1.5	230 Nm	120 Nm	12 mm
	M33 x 2	540 Nm	225 Nm	17 mm
	M42 x 2	720 Nm	360 Nm	22 mm
	M48 x 2	900 Nm	400 Nm	24 mm

1) The tightening torques apply for screws in the "dry" state as received on delivery and in the "lightly oiled" state for installation.

2) In the "lightly oiled" state, the M_V is reduced to 10 Nm for M10 x 1 and 17 Nm for M12 x 1.5.
